

## Handouts

Inspiring others: prepare and deliver the best presentation of your life... every time

In this document you will find the slides and notes of the training: **Inspiring others: prepare and deliver the best presentation of your life... every time**. We regularly publish videos and posts on various topics revolving around effective scientific communication on our [blog](#) (for example, you can download a LaTeX template to produce handouts like the ones you are reading, but based on your presentations [here](#)). You can also [subscribe for updates](#) on our posts and on future trainings and follow us on [facebook](#), [LinkedIn](#) and [YouTube](#).

Inspiring others:  
Prepare and deliver the best presentation  
of your life... every time

Columbia disaster  
2003

Edward Tufte has [traced back](#) one of the issues of the Columbia disaster: Boeing consultants failed to deliver the conclusions of their investigations through their presentations. While their main message was that more research was required to assess the damage to Columbia, NASA directors understood that the damage was not significant. The Columbia space shuttle ended up burning down during atmospheric re-entry, and the full crew died.

## How to plan, design, and deliver the best presentation of your life

- day 1      Effective structure  
Brainstorm your ideas  
3' exercise, preparation 10' presentation
- day 2      Design of effective slides  
Stage presence  
Attention getter and closing
- day 3      10' presentation exercise

## Like presentations, feedback is better delivered when efficient

- |                   |   |
|-------------------|---|
| No judgement      | The way you stand is not good                       |
| Consequences      | Your movements can be distracting                   |
|                   |   |
| No interpretation | You did not prepare enough                          |
| Focus on facts    | I saw no connection between your main points        |
|                   |   |
| No reproach       | You should have used another colour than green      |
| Suggestion        | Next time, you might try another colour than green. |

## Effective communication is getting the message across

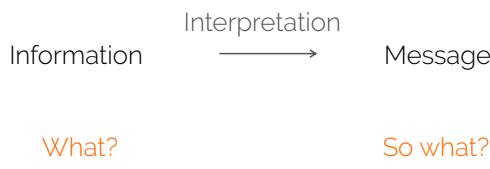

- It implies someone else:  
**the audience**
- understands the message
- remembers it
- is convinced of it
- acts on the basis of it

To ensure that you manage to get your message across in your future presentations; in this course we introduce you to the fundamental principles of effective scientific communication. We first focus on the structure; then on designing effective slides, stage presence, attention getter and closing. Finally you get to put everything into practice in the last half day with a 10' presentation.

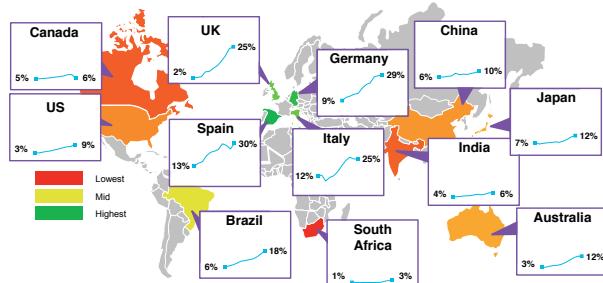

Part of the important skills to continue learning on effective presentations after this training is the observation of others. By giving feedback to others you also organise these thoughts and develop your expertise.

The primary objective to keep in mind when planning, designing, and delivering your presentations is to **get your message(s) across**.

A message presents  
intelligent added value

### Renewable energy proportion of power generation, 2006-16

Effective communication is  
optimisation under constraints

Get your audience to  
pay attention to  
understand  
be able to act upon  
  
a maximum of messages given constraints

Thus, you need to be able to identify your messages and differentiate them from information. A message provides intelligent added value to information. It involves interpreting the information for a specific audience and a specific purpose. It answers to "so what?" (or what is so important about this piece of information) instead of "what" (what this piece of information is).

Example of a slide with information, not messages. There are many different possible messages that the presenter could be giving us with this image, but what (s)he wanted to tell us is not explicitly written here, there is only information.

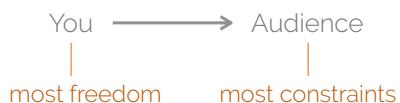

You want the audience to do something with your message, given **the constraints** of the situation: some of them you can anticipate, others will be out of your control.

## The three laws for effective scientific communication

- 1 Adapt to your audience
- 2 Maximise the signal-to-noise ratio
- 3 Use effective redundancy

## The three laws for effective scientific communication

- 1 Adapt to your audience
- 2 Maximise the signal-to-noise ratio
- 3 Use effective redundancy

## The three laws for effective scientific communication

- 1 Adapt to your audience
- 2 Maximise the signal-to-noise ratio
- 3 Use effective redundancy

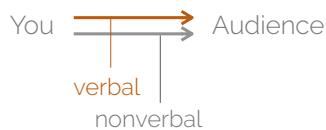

It is your responsibility as a presenter to adapt to your audience, to think of their situation and possible limitations so that they can **understand** your message.

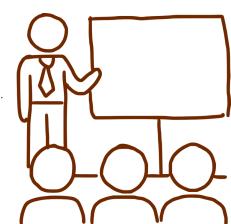

Anything that comes between you, your messages, and the audience is considered noise. Whatever does not directly contribute to your message is noise.

## The three laws for effective scientific communication

- 1 Adapt to your audience
- 2 Maximise the signal-to-noise ratio
- 3 Use effective redundancy

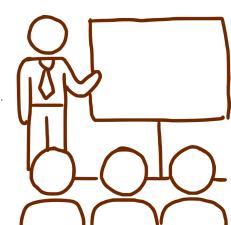

## 5 steps for the best presentation of your life... every time

- 
- 1 Organise your ideas
  - 2 Find the message and structure
  - 3 Design your slides
  - 4 Deliver the presentation
  - 5 Answer the questions

Effective redundancy is crucial in oral presentations. It can be applied through verbal/non-verbal communication, it should be incorporated in the structure and both the speech and the slides should be redundant.

Starting with your next presentation, you can apply these five steps from the idea to D-day.

## 5 steps for the best presentation of your life... every time

- 
- 1 Organise your ideas
  - 2 Find the message and structure
  - 3 Design your slides
  - 4 Deliver the presentation
  - 5 Answer the questions

Prepare a small presentation (3min)  
without slides

Learning objective:

Brainstorm

Structure

## Organise your ideas by replying to these questions

Why Purpose

Who Audience

What Content

When Time constraints

Where Space constraints

In the first step, we will use a piece of paper (you can also use a digital piece of paper like one of my favourite softwares Evernote) to answer these questions.

## Organise your ideas with efficient brainstorm

David Allen's technique

What is the best way to plan?  
The master planner is in all of us

There are things our brain is not very good at,  
but there are others it can brilliantly do, [planning](#)

## Organise your ideas with efficient brainstorm

- 1 Defining purpose and principles
- 2 Outcome visioning
- 3 Brainstorming
- 4 Organising
- 5 Identifying next actions

- 5. at the end but on top
- 1. **why** you are doing this project
- 2. how a positive outcome look like
- 3. jot ideas without judging or organising
- 4. identify significant pieces, add details (**organise**)

|              |  |
|--------------|--|
| Next actions | <input type="checkbox"/> _____<br><input type="checkbox"/> _____<br><input type="checkbox"/> _____ |
| Purpose      | _____  |
| Outcome      | _____  |
| Brainstorm   | _____<br>_____<br>_____<br>_____<br>_____  |

The following steps are explained in details by David Allen in the following [video](#).

Starting with the purpose, try to answer the question "why". Then after visioning the positive outcome of your project/work/presentation (this is of course applicable to many aspects of your life), your brain will start having thoughts on different aspects. At this stage, it is important **not** to judge or organise these thoughts. When the flow of ideas decreases, you can start organising, which will probably lead to other ideas. At the end, write on top of your page what will be the next action to move this project forward. More details [here](#).

Prepare a small presentation (3min)  
without slides

Learning objective:  
Brainstorm  
Structure

3 min presentation in group

How is the presentation structured?

What did you like?

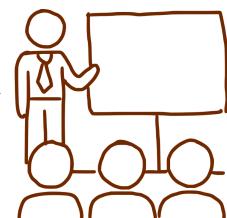

What would you do differently?

Learning objective:

Oral expression

Observation-Feedback

## 5 steps for the best presentation of your life... every time

- 1 Organise your ideas
- 2 Find the message and structure
- 3 Design your slides
- 4 Deliver the presentation
- 5 Answer the questions

Oral presentations convey  
one main message

|              |  |
|--------------|--|
| Main message | The sentence that the audience should remember |
|              | Stated early in the presentation               |
|              | Identified early in the preparation            |

Oral presentations have three main parts

Oral presentations have three main parts

|         |  |
|---------|--|
| Opening | Attention getter<br>Need<br>Task<br>Main message |
| Body    | Supporting messages                              |
| Closing | Conclusion<br>Close                              |

An **effective structure** makes use of **effective redundancy**

|                     |
|---------------------|
| Attention getter    |
| Need                |
| Task                |
| Main message        |
| Preview             |
| Supporting messages |
| Review              |
| Conclusion          |
| Close               |

The main structure of an effective presentation follows these steps. After an effective **attention getter** providing some context, the **need** to be addressed is introduced. Then the **task** describes what you did to tackle this need. You can finish the first part of the presentation by stating your **main message**. In the **preview** you just outline your upcoming **supporting messages**, which explain the main message or give details to the **body** of your talk. Just before the **conclusion, review** the main points and then **close** efficiently, for example by trying to loop back to the attention getter.

Each element has its own focus

|                            |                          |
|----------------------------|--------------------------|
| Audience                   | Attention getter<br>Need |
| You                        | Task<br>Main message     |
| <u>Preview</u>             |                          |
| <u>Supporting messages</u> |                          |
| <u>Review</u>              |                          |
| Audience                   | Conclusion<br>Close      |

Prepare the structure of your 10 min presentation and then discuss with the group

The focus starts with the **audience** in the attention getter and the need. Then it shifts to **you** with the task. At the end, you come back to the audience with the **conclusion** and the **close**.

Try filling in the structure seen before. At this stage use one piece of paper (or one post-it), per message . Then it is easy to organise your talk. Don't go on your computer yet.

Learning objective:  
Structure  
Observation-Feedback

**Find your message**  
and the supporting elements

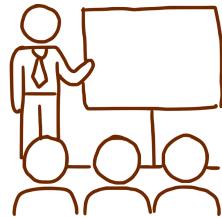

Develop the storyboard of your presentation

Focus on the messages not the design

Sketch with paper and pen (or anything else than ppt)

Organise

## 5 steps for the best presentation of your life... every time

- 1 Organise your ideas
- 2 Find the message and structure
- 3 Design your slides
- 4 Deliver the presentation
- 5 Answer the questions

The laws of communication  
should always drive your choices

Adapt to your audience  
Ask the organiser and  
check who presents in your session

Maximize signal to noise ratio  
Remove anything that is not the message

Use effective redundancy  
You could understand without looking  
or without listening

**Design your slides** right  
or don't do them at all

Slides are for conveying messages  
the same ones as the speech

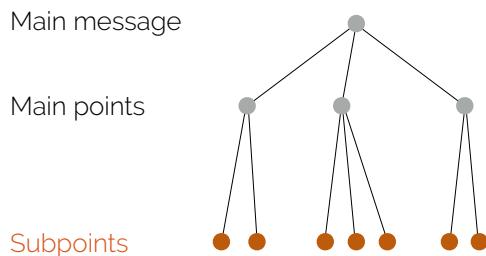

Slides should stand on their own  
but they need not include all the speech

Slides are a choice  
a presentation can be effective without them

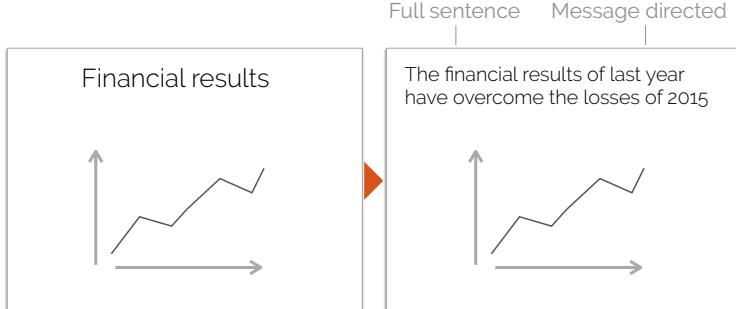

The three laws of communication also  
apply to designing your slides (and to  
preparing any other document: a paper,  
report...).

If limited in time, you better focus on re-  
hearsal than on producing slides. Keeping  
this in mind, and knowing that we  
always wrestle with our agenda, plan  
enough time for rehearsal. As a rule of  
thumb, I rehearse at least three times the  
full presentation (in front of an audience  
or recording myself). Slides need to be  
redundant and self-explanatory but that  
doesn't mean that everything that you is  
written on the slide itself: your spoken  
text will certainly be richer than what's  
written on your slides.

One message per slide  
conveying your subpoints

Break the habit of "what" title  
and replace by "**so what**"

Create your slides only after thinking about your structure: first determine your main message, main points and the subpoints required to develop them. Each slide conveys **only one message**, which corresponds to each one of the subpoints of your presentation. These messages should go in a prominent position: the slide title. Start drafting **by hand (not with powerpoint)** how your presentation will look like: the messages (titles) of each one of your slides and the elements that you will use to support them. By forcing yourself to start drafting by hand and not on your computer you will make sure you focus on the messages (and don't get lost with all the design features of your slides) and will eventually save a lot of time.

This is an illustration of the fundamental difference between the "what" and the "so what". How many slides like the one on the left have you seen? The one on the right interprets the information so that your audience knows what your message is.

The major noise of slides  
is usually **too much text**

Speakers create slides for themselves  
Cryptic and text heavy

Speakers create slides as handouts  
In a drive towards efficiency,  
but being two times ineffective

Speakers copy from written documents  
Graphs and statements need to be adapted  
for an oral presentation

Non message oriented designs  
distract from the content

When you ask people what's the main problem of slides in general, their answer is: too much text. When these people design slides themselves, they very likely end up with too much text too. Why? For these three reasons mostly. Slides should never be a guide for the speaker, they are meant **for the audience**. Don't use slides as a way of avoiding rehearsal. Slides are also not handouts: if you try to design them as such you will end up with too cluttered slides which are also ineffective as handouts for being too light for this purpose. Prepare handouts as a separate document, such as the one you are reading. Finally, slides should not copy full paragraphs or sentences from written documents: they are a different means of communication and require its own preparation.

Sometimes we want to keep the audience's attention by introducing visual effects. In practice, these are noise and people might end up remembering you for the animations you used but not the message of your presentation.

### Triple aim goals improved in all dimensions

Outcome, Cost, Satisfaction

Brains perceive **differences** keep them where it matters

Avoid non useful differences between slides

Keeping your slides simple helps spotting differences

Replace the necessary animations by multiple slides with differences

Keep your lists with max 5 items and ideally 3

Brains have difficulties capturing more than 5 elements

It is most comfortable when limiting to 3

When more items, group them

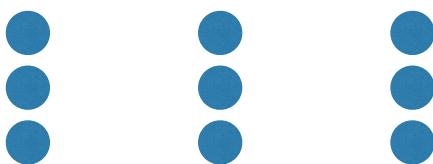

Icons are very trendy now, people tend to believe that their presentations are more appealing and 'professional' with them. Thus, they end up forcing certain icons to represent categories that mostly end up looking artificial and distracting the audience from the message.

Use differences in slides to highlight. Keep your items consistent not to distract the audience. For example: use same font size and type across the presentation, keep all slide titles in exactly the same position and use guidelines to make sure that your text is always aligned to the same horizontal position.

To be convinced, try to show a list of more than 5 items to an audience, you will see their face changing and it'll be obvious that they are struggling.

Our brain cannot directly see how many point are displayed here.

By grouping the points, their total number is directly obvious to us.

References can be useful  
but can also be noise

Presentations are not articles. If you need to acknowledge the work of someone, of course do it, but in the handout.

Why do you add a reference?

Author should be  
acknowledged

Read more option  
for the audience

Noise

Useful

Only in the handout

In a compact way  
Smith, 2016

Take advantage of space  
and let it enter your slide

Fonts are important but  
don't overthink them

Avoid the common issues:  
**no serif**  
*should be readable*  
**not overrated**

Keep the same font for all the slides

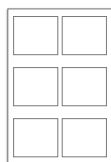

Careful with equations

Size often matters

Too big uses too much space

Too small is difficult to read

Tip: print your slides 6 per A4  
it should still be readable

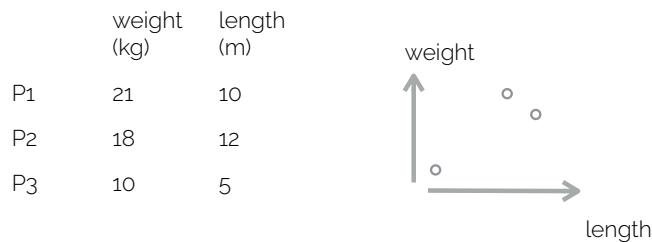

Don't hesitate to leave space on your slide. As silence will be to your speech, space is a powerful tool.

Once you have settled for a specific font, use it throughout your presentation: don't change it. Avoid the common pitfall by using a clear font without serif—which is easier to read from a projector and looks cleaner. Pay attention to the font used in equations.

Whatever cannot be properly read in a slide becomes noise for the audience. Use this tip to make sure that your items are not too small. Pay special attention to tick marks and axis titles of your graphs: be aware that graphs need to be adapted for a presentation most of the time to make sure that they are readable and clear.

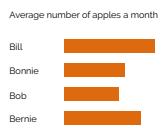

Use table for overview,  
graphs for connections and trends

Same data, two different messages

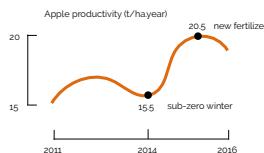

There is an intrinsic difference between a table and a graph. The table will provide an overview of some data without direct link. The graph is used to emphasise a trend. Too long tables do not belong to presentations though, as it will be difficult for your audience to interpret them. Whenever you present a table or a graph, drive your audience through it and explain the different elements to make sure you keep the attention.

To make your graphs effective  
reveal what they have to say

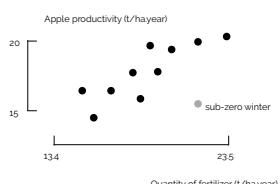

Bar charts reveal comparison  
(use horizontal for clarity)

Lines reveal evolution

To make your graphs effective  
reveal what they have to say

Points displayed on two scale  
to explore correlation

Present equations as  
a block diagram

**LP solution approach**

$$\min z = \sum_{y=0}^{M-2} \sum_{i \in L_y} \sum_{j \in L_{y+1}} C_y(i,j) X_y(i,j)$$

S. t.

$$\sum_{j \in L_1} X_0(i,j) = A_i ; i \in L_0 / \{VI, VO, W, Ret\}$$

$$\sum_{i \in L_{y-1} / \{VO\}} X_{y-1}(i,j) + X_{y-1}(j, VI) - \sum_{i \in L_{y+1}} X_y(j,i) = 0 ; y \in \{0, \dots, M-2\}, j \in \{1, \dots, N\}$$

$$\sum_{j \in L_{y+1}} \sum_{k \in L_y} X_y(k,j) = rm_y(i) ; y \in \{0, \dots, M-2\}, i \in \{1, \dots, K\}$$

$$MinRec \leq \sum_{i \in RecSet} X_y(W,i) \leq MaxRec ; y \in \{0, \dots, M-2\}$$

$$\sum_{i \in RetNonY \cap SkillSet_y(s)} X_y(i, Ret) + FlexRet \times [X_y^s(VI, Ret) - X_{y-1}^s(VI, Ret)] = AllowRet_y(s)$$

$$\sum_{i \in RetNonY \cap SkillSet_y(s)} X_y(i, Ret) - \sum_{i \in RetY-SV} X_{y-SV}(W,i) + FlexRet \times [X_y^s(VI, Ret) - X_{y-1}^s(VI, Ret)] = 0$$

14 .be

If you're attending a presentation and such slide appears: would you try to follow and understand these equations? Or rather 'switch off' and stop paying attention?

Present equations as  
a block diagram

Only include equations  
to support the message

No need to be exhaustive

Weber number at injection

$$We_{inj} = \frac{m v_o d_o}{V s}$$

injection velocity  
mass    |    injection diameter  
volume    |    surface tension

Only when absolutely necessary  
indicate page and structure

When using equations in your presentations, help your audience by placing the information where they need to see it.

Black region to extract it  
from slide content

When the structure and/or the page number need to be provided (we suggest you try without them most of the time), you can apply this trick. Beware that you are losing space though.

(optional) can be used  
to convey the structure

No mention of total  
number of slides

This is an amazing template

It is

- beautiful
- noiseless
- effective
- like my colleagues are doing

Francesco Contino  
Training Presentations  
Vrije Universiteit Brussel

VRIJE  
UNIVERSITEIT  
BRUSSEL

41/62

Are templates really necessary or do they just add noise to your presentation? Will the audience more likely remember you (and your message) for having a logo repeated all over your slides or for giving a clear, noiseless, well structured and well delivered presentation?

This is an amazing template

This slide is beautiful, noiseless,  
and effective

Less is more, don't hide your message  
behind features of your slides

The best template is **always** a blank slide that gives priority to the message and minimises noise.

## Applying a multiple benefits approach

The multiple benefits approach includes three key recommendations:

■ **Apply the multiple benefits approach to energy efficiency policy development**

- Consider which benefits are relevant in country context

■ **Pay more attention to impact assessment; take an innovative approach**

- Engage a range of stakeholders; community level experts
- Adapt existing tools to capture hard-to-measure impacts

■ **Build consensus on methods for data collection and assessment so that results are comparable across countries and experience can be meaningfully shared**

Example of a rather noisy slide.

The multiple benefits approach includes three key recommendations

■ **Apply the multiple benefits approach to energy efficiency policy development**

- Consider which benefits are relevant in country context

■ **Pay more attention to impact assessment; take an innovative approach**

- Engage a range of stakeholders; community level experts
- Adapt existing tools to capture hard-to-measure impacts

■ **Build consensus on methods for data collection and assessment so that results are comparable across countries and experience can be meaningfully shared**

© OECD/IEA 2014

To improve: remove noisy elements and place the message as slide title.

The multiple benefits approach includes three key recommendations

Apply it to energy efficiency **policy development**  
Consider relevant elements in the country's context

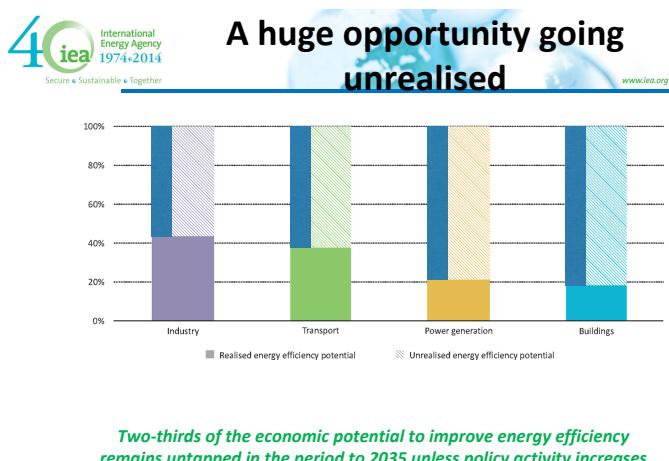

Pay more attention to **impact assessment**

Engage a range of stakeholders  
Adapt existing tools to capture hard-to-measure impacts

Agree on **data collection and assessment** methods

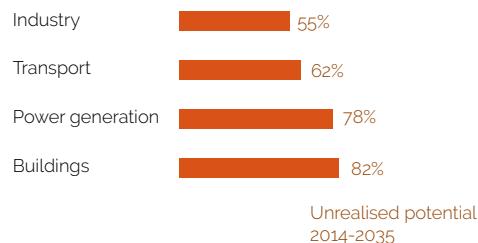

Results are comparable across countries  
Experience can be meaningfully shared

A possible improvement.

Another improvable example.

Two thirds of the economic potential linked to energy efficiency remain untapped

Remove legends in graphs to avoid having to read the graph in two steps. Horizontal bars make it easier to display categories. Limit colours to avoid noise.

Take your difficult slide and find a way to change it

Learning objective:  
Design of slide

Have a strong beginning and a clear end

|          |                     |
|----------|---------------------|
| Audience | Attention getter    |
| You      | Need                |
|          | Task                |
|          | Main message        |
|          | <u>Preview</u>      |
|          | Supporting messages |
|          | <u>Review</u>       |
| Audience | Conclusion          |
|          | Close               |

Have a strong beginning  
and a clear end

A strong beginning and  
you are off on the right foot

Respect by making your talk interesting  
not by thanking your audience

Clear end to avoid awkward silence

Convey the structure when needed  
and only when it makes sense

Where is structure added?  
When the public knows why it matters  
to listen to you

What is needed in this structure?  
Only what is not obvious  
Forget intro and conclusion

Structure needed in all slides?  
Generally no

Avoid stating your name and title when  
you take the stand. All needed information  
should be on the first slide which  
should be displayed when presented by  
the chair(wo)man.

During rehearsals, try to take extra time to  
master the beginning of your presentation.  
This will kickstart your talk and help  
you go through the rush of stress that  
everybody gets at the beginning.

The end of the presentation should also  
be strong and clear. Avoid decreasing  
the level of your voice while saying  
something like "thank you for your attention,  
if you have any questions..." Test  
the following: loop with a reference to  
your attention getter or call for action  
from the audience and try very hard not  
to say thank you (like everybody else).  
This will force you to have a clear and  
nicer end.

A table of contents is better displayed  
when your audience understands why it  
is important that they pay attention to  
you. As a presentation is different from  
a book, don't use a table of contents the  
same way. Wait until after the main message  
(or together with it) and try to be  
concise. No need to add points like "introduction"  
or "conclusion", most of the  
presentations have these parts and always  
at the beginning and end, respectively.

## Fight against usual misconceptions

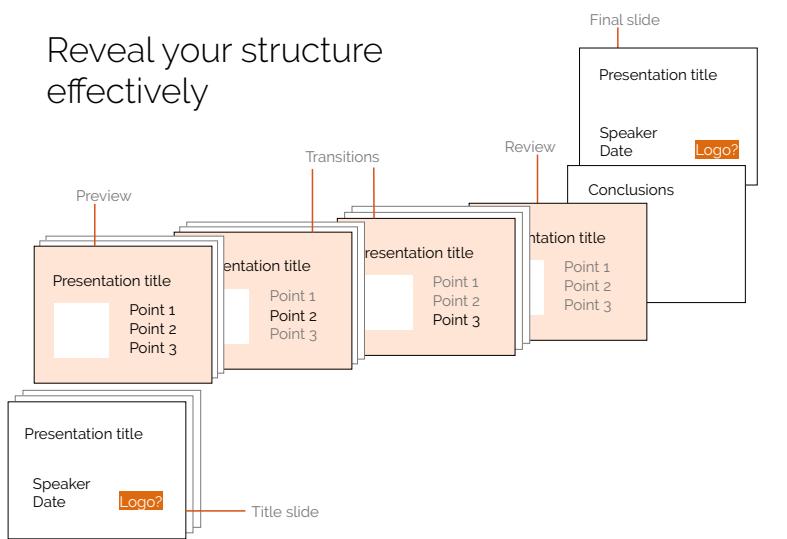

Don't use template for the sake of it

Same affiliation between first and last slide,  
remove the logos for all other slides

Science shouldn't be artificially complex  
simple is also impressive

Asking three times why to your supervisor

## Reveal your structure effectively

Use the same slide for your preview, re-review and transitions. You can have a distinctive image in it or even use a different background colour to differentiate it from the rest of your slides. When you change from one point to another, highlight it on your slides.

## 5 steps for the best presentation of your life... every time

- 1 Organise your ideas
- 2 Find the message and structure
- 3 Design your slides
- 4 Deliver the presentation
- 5 Answer the questions

## Delivering the best presentation starts with a **lot of rehearsal**

Rehearse, rehearse, rehearse

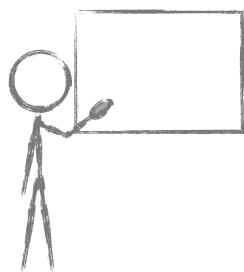

Ask colleagues or record yourself

Use physical feedback

Pay attention and learn transitions

A physical feedback is best used only for rehearsal and can be a chair placed next to you to feel it when you move. Ideally, you should know by heart what will be your next slide. No need to know your full presentation by heart though: it is unnatural and it can lead to a blank mind if you forget a piece. There might be specific sentences in your presentation, or transitions, that you might have troubles with and that are worth memorising.

## Nervous is less trustworthy, a confident stance helps a lot

Ski boots to avoid nervous legs

Look at your public and convey emotions with your face

Use hands deliberately without noise

Be sincere

During rehearsal focus on your position and take the time to look in the eyes of your audience.

## Timing is everything

Timing: 1 slide = 1 minute (first approx.)

Generally faster in front of the audience

It should feel slow during rehearsal to be at the right speed for the public

With time, less is always better

Time is an important constraint for a presentation. Measure it and keep it under control. Even if you rehearse, you could very well be overtime in some cases. When this happens, don't rush the rest of your presentation but rather skip some parts. You might get a chance to get back to them during the questions, while rushing and taking more time will most likely get your audience angry.

Remove all verbal noise and  
keep voice variation as a signal

You did it for your slides,  
do it for your speech

Aim for effective redundancy

Adjust voice to situation and content

This is probably a good reason to record yourself. You will see the verbal noise or gestures you introduce while you talk. Pay attention to reduce them as much as possible. Once you know them, it will be much easier to avoid them.

When complexity is needed  
deal with it effectively

When a long piece of text is included  
read it with the public

Complicated words:  
know by heart or simplify

An example of a quote that might be relevant: when introduced, the speaker should read it out loud with the audience.

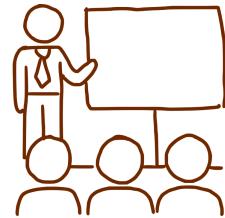

#### FINDINGS

##### 3. LIFE EVENTS CAN SIGNAL TRANSITIONS AND EFFECTS

- Life events can signal transitions as a **breakingpoint or gradually**
- **Short-term and long-term effect** of such recent life events
- Certain life events are **affecting** older adults subjective feelings of **frailty and life outcomes** in a more positive or negative way
- **Cumulative effect** (one life event can affect multiple life domains )

*"Loneliness. Absolutely. Yes, very often. That I am crying then and that I light a candle and then I take my car and drive to the graveyard to my daughter. And there I am talking and chatting to her, or I cry."*  
*(70-year-old widowed woman)*

## 5 steps for the best presentation of your life... every time

- 1 Organise your ideas
- 2 Find the message and structure
- 3 Design your slides
- 4 Deliver the presentation
- 5 Answer the questions

### Take questions as opportunities to get time to talk again

Listen wait until the end and make sure you understood

Repeat/rephrase if needed and address directly the person

Think to make a short and well constructed answer

Answer with a positive "yes and ..." instead of a defensive "no but ..."

### Deal with aggressive questions as an expert in Ju-jitsu

Stay calm and wait a little to produce a "loud silence"

Be surprised when you feel the attack is not justified

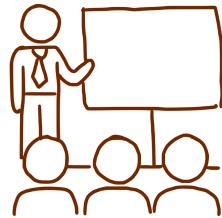

Understand the concern but if based on assumption, question it back

When not understanding, suggest to discuss it later

Questions are a real opportunities to get feedback from your audience. Some might not have understood one of your messages and their questions give you the chance to get everybody on board. Moreover, it is also an opportunity to dig deeper in some aspects or to insist in some of your messages. Follow these steps to make sure you have a strong answer to the questions.

Sometimes you will encounter aggressive questions. In these cases, stay calm and play the "surprised card". Avoid entering a debate in front of everybody else (most probably not interested) and offer to discuss the problem after the talk.

## 5 steps for the best presentation of your life... every time

- 1 Organise your ideas
- 2 Find the message and structure
- 3 Design your slides
- 4 Deliver the presentation
- 5 Answer the questions

Starting on the right foot  
sets you up for the rest

Use a short but effective attention getter  
so audience focuses on the **need**.

Make a link with what your audience  
is interested in.

Don't start with: "Hello. My name is..."  
This is self-centered. Audience first.

15' Prepare your attention getter alone

15-30' Test it on the group  
remind what is the topic afterwards

Feedback:

Did you get the link with the message?  
What would you suggest to improve?

Learning objectives:

Get a strong beginning  
Observation-Feedback

A strong closing gives you  
an edge for the interview

Indicate clearly that you have finished.

Avoid the traditional thank you  
make it elegant instead.

Prepare your audience for the end  
and loop back to your attention getter.

15' Prepare your close alone

15-30' Test it on the group

Feedback:

Did you get the link with the message?  
What would you suggest to improve?

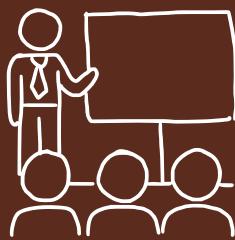

Learning objectives:

Get a strong close

Observation-Feedback

Inspiring others:  
Prepare and deliver the best presentation  
of your life... every time
